ABOUT ME

I am a Java Development Lead with extensive experience in the Fintech industry, specialized in building, modernizing, and integrating financial and payment platforms. I have worked across both large-scale payment gateways and core banking systems, with a strong focus on Java, Spring Boot, microservices, Kafka, REST APIs, and distributed systems.

My experience covers the full software lifecycle, from architecture and development to deployment and 24/7 production support. Alongside my technical responsibilities, I lead and mentor developers, conduct technical interviews, and collaborate closely with Business Analysts, Architects, Product teams, and other engineering teams to deliver scalable, reliable, and maintainable solutions.

Java Development Lead

At **Banca Transilvania**, I am helping with the development and modernization of core financial platforms, with a strong focus on re-engineering legacy systems and moving them towards modern, maintainable architectures. One of my key responsibilities is driving the migration of the back-office platform from FlowX to Spring Boot-based applications, working closely with the team to ensure a smooth transition while maintaining business continuity and delivery standards.

Alongside my technical responsibilities, I contribute to building and growing the development team by conducting technical interviews and helping identify and select Java developers who are a strong fit for both the technical and collaborative needs of the team. As a **Line Manager for five developers**, I support their professional growth, provide guidance, and help establish an environment where the team can perform effectively.

I also work closely with **Business Analysts, Solution Architects, Product teams, and other engineering teams** to align technical implementation with business requirements, coordinate dependencies, resolve challenges, and ensure projects are delivered on time and to the expected quality standards.

AI-Assisted Engineering: AI is integrated into the **software development lifecycle** across development, code review, requirements analysis, and implementation support.

GitHub Copilot is used directly in the IDE, alongside a dedicated **GitHub code-review agent** for automated code reviews. Custom **.md files** capture the project structure, architecture, coding conventions, and implementation guidelines, providing Copilot with the context required to implement new stories effectively.

Relevant **Confluence requirements and technical documentation are converted into structured .md files**, creating a project-specific knowledge base for AI-assisted development. **ChatGPT** is also used for technical analysis, problem solving, and exploring implementation approaches.

Technologies & Architecture: Java 21 (Records, Sealed Interfaces, Pattern Matching, Virtual Threads), Spring Boot 3.3.2, Modular Monolith, Domain-Driven Design (DDD), CQRS, Redis (production session/journey store), MinIO, Keycloak, Bearer Token Authentication, Kubernetes/OpenShift, JaCoCo, SonarQube.

ENDAVA
Cluj-Napoca
Jan 2019 - Oct 2025
6 yrs 10 mos

Java Developer

At **Endava**, I contributed to the development of a new, standalone **microservice-based payment platform designed to support 200+ payment methods globally** and serve multiple clients and use cases.

- SWAGGER
- OPENAPI
- CI/CD
- JENKINS
- CLOUDBEES
- OPENSIFT
- SPLUNK
- SYSDIG
- SONARQUBE

PERSONAL DETAILS

Nationality
Romanian

Date Of Birth
21 May 1995

My work covered the full software lifecycle, from design and development to deployment and **24/7 production support**, with a strong focus on scalability, reliability, security, and observability. I developed and maintained shared libraries and a standardized service accelerator, implemented centralized logging, distributed tracing, and aggregated metrics, and designed patterns for security, fault and latency tolerance, configuration management, load balancing, and service discovery. I also built and maintained **CI/CD pipelines** using Jenkins and CloudBees, while using Splunk and Sysdig for production monitoring and troubleshooting. In parallel, I maintained and enhanced the existing payment gateway, ensuring its continued reliability and business continuity.

Alongside my technical responsibilities, I contributed to **team growth and engineering initiatives** by conducting technical interviews, mentoring interns, and participating in Agile ceremonies including PI Planning, Iteration Planning, and System Demos within a **SAFe** framework. I also helped maintain high standards for application security and code quality through **Black Duck, Checkmarx, and SonarQube**, while leveraging GitHub Copilot for AI-assisted development.

Technologies & Architecture: Java, Spring, Maven, Kafka, Git, SQL, Cassandra, PostgreSQL, Microservices, REST, Swagger/OpenAPI, CI/CD, Jenkins, CloudBees, OpenShift, Splunk, Sysdig, SonarQube, Black Duck, Checkmarx, GitHub Copilot.

Java Intern

As a Java Intern, I was part of an Agile development team responsible for the development and maintenance of Garmin's website.

My work focused on backend tasks using Java and the Spring framework. I actively participated in Agile ceremonies such as sprint planning and retrospectives, collaborated with the testing team to ensure code quality, and received one-on-one mentorship to enhance my technical and professional development.
